We are living in and through an ever-increasing catastrophe caused by the interlocking march of environmental destruction and the systemic violence of colonialism and social inequity. Curators Angelika Fitz and Elke Krasny articulate this condition of living together on a broken planet, which requires a radically different ethics of how we relate to one another to sustain life amidst such ruination (Fitz & Krasny, 2019). Within this context, it seems that a turn to living with and through an ethics of care is the only path out of our current maelstrom. As an approach to research and practice, care centres living together in ways that stretch across our deep connections to each other and more-than-human lifeworlds. In a recent roundtable discussion on resistance to extraction for sustainable futures, activist Jen Gobby spoke on her work supporting land defenders and meaningful climate action, sharing profoundly that "care is the antidote to extractivism" (Gobby, 2026). In this configuration, global systems of capital that have been oriented only towards taking can be overturned through the mutuality of caring relations. Care holds potential to re-structure our world if we commit to its practice, however, it is not simply a future ideal that we dream of achieving. Care networks of mutual aid and ecological interdependence have *always* been crucial in sustaining life amidst and through injustice and violence. They have deep histories that resonate through present day practices that help us map alternative ways of living.

As landscapes are constituted through thick, more-than-human relationships that rely on one another and build the environments we inhabit, care as a social, cultural, and ecological practice is fundamental to our understanding of landscape. Feminist theorists Berenice Fisher and Joan Tronto define care as:

> A species activity that includes everything that we do to maintain, continue, and repair our 'world' so that we can live in it as well as possible. That would include our bodies, our selves, and our environments, all of which seek to interweave in a complex, life-sustaining web (Fisher & Tronto, 1990, p. 40).

This definition of care links us to our environments, but also allows for thinking across scales and disciplines in a way that is ideally suited to understanding the complexity of landscape. In this special issue on 'Landscapes of Care' we bring together work that articulates how, through resistance and practice, an orientation towards care has made life possible and continues to shape the potential for convivial futures. This centring of care is not to suggest it as a panacea that can undo all harms, but as a practice to re-attune our complex worlds. Beyond the multivalent ways that care entwines with landscapes, we further look to care and the thick relationships it creates as ways that our research practices can be re-configured to ensure our work is meaningfully contributing to struggles for environmental justice.

The body of scholarship on care has grown exponentially over the past five years, revealing the diverse ways care is entangled with our lives, and specifically how landscapes have been shaped by care relations in deep and meaningful ways that of course pre-date this more recent scholarly interest in the topic. Recognizing this amazing growth in research that is centring care, our intention within this introduction is not to provide a comprehensive review of literature that understands landscape through lenses of care. Instead, we have drawn out some themes of care that are woven through the pieces in this special issue to articulate ways of understanding how landscapes are formed and maintained through relationships of care.

Maintenance and Care

Questions of care extend from research and literature on landscapes into the very practice of their making and maintenance. The care and maintenance work of landscape has always been integral to their design and construction as well as the connections that are formed between landscapes and those who care for them. Landscape architect Julian Raxworthy's work has articulated the relationship between landscape architecture and gardening to re-affirm the importance of the maintenance and the viridic plant material that are foundational to vital landscapes (Raxworthy, 2023). Landscape architect Michael Geffel has shown the ways in which maintenance is an important phase in the design of landscapes that shapes their form and quality (Geffel, 2021). Geffel's practice-based research with the LND LAB has further considered landscape care as a way to repair the contaminated and degraded landscapes left behind from industrial growth and infrastructural incursion.[1] Artist and landscape designer Liska Chan's braided fields have similarly made care and the work of maintaining vital plant materials visible within the landscape as traces of care and human touch.[2] Over the past seven years, the work of Test Plot and its network of volunteer stewardship practitioners has shown us how restoration experiments on degraded land can create both vibrant landscapes as well as foster "care-based relationships between communities and public lands."[3] These practices of care within the landscape are fundamentally place-based, emerging from specific ecological and social contexts that form uniquely constituted maintenance routines.

Through her foundational work 'Messy Ecosystems, Orderly Frames' landscape architect Joan Iverson Nassauer has shown the ways in which a landscape language that socially transmits a human intention to care are essential to make visible the significance of what could otherwise be perceived as messy remnant landscapes (Nassauer, 1995). Often these messy landscapes are spaces resulting from great ecological care, however it is only through 'cues to care' that their value and significance can be communicated to wider audiences. Further developing this work on 'cues to care' through a review of how the theory has widely been taken up by research within landscape architecture, interdisciplinary scholar Jiayang Li and Joan Iverson Nassauer further articulate the ways in which maintenance is socially and culturally situated, underscoring how these acts of maintenance relate us to the landscape and one another (J. Li & Nassauer, 2020). Although these cues to care have often been taken up within more technical discourses on the maintenance of landscapes, Li and Nassauer show how cultural traditional and social norms shape how intention is communicated and reinforce the sociable relationships between care and landscape.

Care and Labour

Such relationships often form at the scale of the human that is enacting care work; however, as interdisciplinary scholar Shannon Mattern explores in her 2018 essay "Maintenance and Care", the maintenance work of "how the world gets put back together" happens across scales within our urban landscapes from the microchip to the motorway (Mattern, 2018). More recent scholarship that considers the labour that goes into the making of landscapes have brought labour and inequality in landscape care work to the forefront (Franco, 2022; Terremoto, 2021). In this scholarship, questioning 'who does care work?' and 'how is the burden of that care distributed?' has revealed the ways that power operates to articulate racialized and gendered burdens of care. Landscape scholar Michelle Franco has specifically examined the use of the H2-B guestworker visa program as a way that mostly Latinx landscape care labour is exploited, while calling for landscape conceptions of care that encompass social care for those doing the work of caring for ecological life (Franco, 2024). In considering the labour of care, feminist scholarship that has considered the unevenness of the geographies of care are instructive for better understanding the complexities of care as they manifest spatially and are rooted in social and ecological contexts. Within design disciplines, Elke Krasny is attentive to how "the politics of gender and race have defined the history of care" and how these political configurations have worked to keep care and architecture separate and hierarchically differentiated from one another (Krasny, 2019, p. 34).

In her recent work on her grandmother's cleaning practices, architecture activist and researcher Menna Agha explicitly considers cleaning over care as a way of resisting the "the overuse and underutilization of the word 'care' in its current position as a generic, charitable, low-stakes, rhetorical, and anemic term" (Agha, 2026). Agha's caution is an important one, as scholarly attention has turned to the language of care, it can obfuscate the everyday practices that comprise care and can alienate those who are doing care work by using detached language removed from the actual work of care. Care is labour, and, as Agha asserts "Care work is backbreaking work that operates in a material collective logic" (Agha, 2026). Geographer Max Liboiron, in conversation with Tim Waterman, makes a similar distinction between chores and care: "chores," they say, "mean interacting with the material world with commitment, which is a land-based sort of ethic" (Liboiron & Waterman, 2026). Although Liboiron further suggests that maintenance and chores and care can overlap, that this is not automatic. This distinction further reminds us of the ways that an uncritical adoption of care as a language without a commitment to its political and material practice can result in capitalist appropriation as we have seen with the move to 'self-care' as a marketable set of consumer items instead of the acts of care as radical re-structuring of life to dismantle exploitation.

Care as Relationality

In thinking through care, we have been inspired by the ways that the relations of care bind us together in more-than-human webs and allow us to think beyond extractive and exploitative practices. Articulating the contours of care, Fisher and Tronto define care through its relations: caring about, caring for, care giving, and care receiving (Fisher & Tronto, 1990). In a later piece of writing, Tronto adds "caring with" as a further configuration of collectivity in care that shares the political burden of orienting towards a future committed to justice (J. C. Tronto, 2013). Each of these understandings of care is inherently relational, attempting to articulate how care operates between actors to build relationships. Feminist theorist and environmental historian Maria Puig de la Bellacasa emphasizes the interdependency of care that stretches across more-than-human actors to extend these webs of care into complex ecosystems of relations (Puig de La Bellacasa, 2017). This

relationality at the centre of the ethics of care is essential for realizing the potential of care to re-shape worlds; however, landscape scholar Sara Jacobs and landscape designer and researcher Taryn Wiens note that often the scholarship that centres maintenance within landscape lacks this obligation to relational possibilities (Jacobs & Wiens, 2024, p. 437). For Jacobs and Wiens, "care is incomplete without a material, relational practice" that forms ways of existing beyond the commodification of care and instead towards kinship (Jacobs & Wiens, 2024, p. 436). Liboiron further emphasizes the specific ways that "queer relations reorganize kinship, land, care, risk, and belonging," offering insight into the ways that queer relationality can further dismantle heteropatriarchal relations of domination (Liboiron & Waterman, 2026).

The relationality of care is not intrinsically radical, however. Tronto reminds us that "all forms of care are shot through with relations of power" which necessitates a constant interrogation of how relations are formed and reinforced to ensure they are not replicating the same inequities they seek to dismantle (Tronto, 2019, p. 32). Further cautioning against the language of care when it is not accompanied by committed action, Liboiron considers how government services framed as care have often been the vehicles for settler colonial genocidal violence (Liboiron & Waterman, 2026). Michelle Murphy has sought to disturb the often romantic temptations of the feminist notions of care, turning to the ways that the language of care works through affect and can reproduce colonial configurations (Murphy, 2015). These cautions, and calls to 'unsettle' care, are significant reminders of the need for continued critique to ensure that as care is increasingly adopted as an ethic, it is not diluted through institutional co-optation and that our practices of care remain responsive to criticism that can strengthen our commitments to one another.

As care extends relationality across actors, it weaves dense networks of connections that create and sustain life. Recognizing the significance of these social connections to reproductive labour, artist Ani Liu suggests that care forms infrastructures and entangled ecologies through its relationality (Utting & Liu, 2024). Architectural scholar Brittany Utting suggests the relationships that are built through care can fill "in the gaps that the state and the market neglect" (Utting, 2024, p. 2). This understanding suggests that care can perform as a supportive matrix in the absence of or amongst crumbling state infrastructures. Examining the response to the undersea volcano eruption on Tonga, designer and architectural researcher Elsa MH Mäki describes the social infrastructures of care and remittances that were foundational to recovery efforts (Mäki, 2024). The turn to socially constructed infrastructures is chronicled by architectural and urban historian Xiuzheng Li, who further posits that communal kitchens act as infrastructures of care within the city, connecting people within space and reconnecting them to the foodways that they have been alienated from (X. Li, 2025). These thick webs of relationality that comprise care are complex and entangled, constructing the landscapes we inhabit and providing possible futures of justice and mutuality.

Landscapes of Care

Beyond the centrality of care to the practices of and landscape, the theme of this special issue further aligns the goals of *Landscape Research* to enact an 'ethos of care' in the editorial work of the journal as well as to think and write with, and through, care. These goals were first explicitly outlined in the journal by then Editor-in-Chief Emma Waterton in the editorials she co-authored in 2021 and 2022 (Vicenzotti & Waterton, 2021; Waterton et al., 2022). This approach to care in editorial practice has been further supported through journal initiatives to bring about more inclusive research and writing practices that have since been upheld under the editorial guidelines of the

journal. As issue editors, we brought together this special issue following a robust response to a call for commissioned essays on care that Zannah Matson and Emma Waterton put together in 2022 for *Landscape Research*. Two commissioned critical review essays were published from that call, but the interest in the theme indicated a need to gather a more representative body of scholarship to further the growing discourse on care within landscape. The results of these efforts are brought together in this issue, which contains work from across landscape disciplines, bringing together perspectives from geography, landscape studies, and landscape architecture.

This issue begins with a series of articles that centre the complex webs of care that are practiced across species and ecologies. In her piece on the Jaguar Corridor Initiative, Juana Salcedo maps and reinterprets this essential migration and habitat corridor as an infrastructure of care for more-than-human life (Salcedo, 2025). In "An infrastructure of care: mapping the jaguar corridor and urbanisation processes in the Americas," Salcedo further articulates how the building of these infrastructures are political processes that are impacted by power relations and inequities in the struggle for environmental justice. Rhea Shah and Natasha Maru focus their attention on how mobility is a form of care for the Rabari pastoralists of Gujarat who traverse the arid lands of Western India to ensure the health of their camels (Shah & Maru, 2025). This relationship between pastoralists, animals, and environment so thoughtfully analysed in "Mobility, milieu and the ethos of care" articulates the dynamic nature of care, while calling attention to the threats such intricate life-webs face. Daniel Finch-Race's article "The art of marsh thinking as ecological care" looks to paintings of marshlands as inspiration for 'marsh-thinking' as a way of conceptualizing togetherness within the landscape (Finch-Race, 2026). Such entangled and dense 'marsh-thinking' as an articulation of care helps expand and consider the more-than-human approaches that can reform the imagination of landscape—often advanced as a tool of control and domination—as one of ecological care.

Turning to the relations of care that shape designed landscapes at the scale of the neighbourhood, a collection of papers attends to the politics of design and placemaking for advancing spatial justice. 'A fair share for all': care, welfare and landscape through a case study of a Scottish New Town' provides a rich and detailed history of Brenda Colvin's design for the town of East Kilbride (Csepely-Knorr & Allen, 2025). Through examining this design for the British Welfare State, Luca Csepely-Knorr and Camilla Allen consider how care is created in our designed landscapes, both in the collective spaces that are designed as well as in the structures of societal welfare. In a contemporary examination of how care operates in our public landscapes, the article "A caring public outdoor space in the eyes of urban refugees in Amman, Jordan" by Hala Ghanem and Ahlam Harahsheh uses feminist care ethics to understand the experiences of urban refugees in the public outdoor spaces of Amman, Jordan (Ghanem & Harahsheh, 2025). This approach reveals how care is relational, emotional, material, and imaginative in ways that challenge neoliberal urban spaces. Similarly focused on the social relationships that create caring publics and the spaces that sustain them, Maggie Hansen further articulates the significance of care in struggles for environmental justice (Hansen, 2025). In "Cultivating a care-full urbanism: learning from land-based organizing in New Orleans", she looks to community-based initiatives in New Orleans that build spaces of mutual aid and care through sustained political engagement amongst community members.

To enact care practices that *maintain, continue, and repair* our landscapes, as Fisher and Tronto describe, requires diverse forms of political engagement that meet and counter the world-eating forces of extractivism and colonialism. Elaine T. Stokes builds on the connection between methods

of Indigenous protest and care stewardship (Stokes, 2025). Looking to case studies of protest and land stewardship, "Protest as care, care as protest" provides insight into the interrelation of methods that are used to defend land from settler colonial capitalism and how these methods signal and enact care. In an incredibly moving image-based essay, Max Cooper-Clark turns to the landscapes of northeast England that have been impacted by lead mining, where lead contaminants still saturate the soils and the bodies of people who live and work amongst this extractive economy (Cooper-Clark, 2025). Focused on the practices of care that are possible through collective and queer reimagining of post-extractive landscapes, the work centres pansies as transformative for toxic soils and instructional for interscalar future imaginaries beyond extraction.

Turning to regimes of maintenance, in "Tending to Yosemite" Brett Milligan examines land-fire stewardship and conservation efforts in Yosemite National Park, and reflects on conceptual frameworks of care that can help shift regimes of stewardship (Milligan, 2025). Amanda Shoaf Vincent considers maintenance and pedagogy at the Lycée Agricole Jules-Rieffel (Vincent, 2026). "The garden in movement as a space and practice of care" turns to a garden developed by professors in consultation with Gilles Clément, to understand how maintenance is composed of practices and methods that are grounded in a relationship between human and plant behaviours. The issue concludes with a Critical Review essay by Jacky Bowring that articulates a series of related design movements that centre slowness and repair (Bowring, 2025). Through "Withdrawal, restraint, attention, and repair: strategies of careful design in the landscape," Bowring helps us consider what a counter-approach to the formalism of modernism and the wastefulness of consumerism may mean for landscape architecture. As a final essay in this issue, Bowring's work provides structure for developing alternative maintenance and design practices that centre care through their restraint and attention to the multiplicity of beings that form care within the landscape.

As editors, it has been a pleasure working with the authors on the pieces included in this issue, and we hope that the work here contributes to developing thinking and scholarship on care within the interdisciplinary study of landscape. Most importantly, we hope the work here inspires you to continue to move with care in your lives, collectively engage with one another, and live in mutual relations with our more-than-human kin to resist extractivism and build care-full futures together.

Notes on contributors

Zannah is an Assistant Professor in the Program in Environmental Design at the University of Colorado Boulder. Her research focuses on the intertwined processes of colonization, extraction, and infrastructure development, both within Colombia's eastern piedmont as well as Canada's extensive mining sector.

Zannah is an Associate Editor for *Landscape Research* and an active member of Beyond Extraction, which is a collective of researchers, writers, artists, and activists who come together to critically investigate and resist extraction in its various forms.

Tim Waterman lives in London and is a Professor of Landscape Theory and Inter-Programe Collaboration Director at the Bartlett School of Architecture, University College London. Tim's research addresses imaginaries: moral, political, ecological, radical, and utopian. This forms the basis for explorations of power and democracy and their shaping of public space and public life; taste, manners, belief and ritual; and foodways in community and civic life and landscape.

Tim is an advisor to the Centre for Landscape Democracy of the Landscape and Spatial Planning Institute at NMBU in Norway, a member of the Scientific Committee of the Barcelona Landscape Biennial, and an international advisor to the CETAPS (Centre for English, Translation, and Anglo-Portuguese Studies) Mapping Utopianisms research area. He is also a former Vice President of the European Council of Landscape Architecture Schools (ECLAS) and a former Non Executive Director at the arts organisation Furtherfield. His most recent book, published by Routledge in 2022, is a collection of my essays and journalism, *The Landscape of Utopia: Writings on Everyday Life, Taste, Democracy, and Design*. He is also the author of *Fundamentals of Landscape Architecture,* which is now in its second edition from Bloomsbury and, with Ed Wall, *Basics Landscape Architecture: Urban Design.*
